

This graph is a relplot of the daily volume of the SPY starting from May 1993 to May 2023. The plot uses the cool warm palette to create a heatmap of the intensity of the volume. To make the visualization more understandable and readable I also made the sizing relative to the volume as well as it would make it easier to understand that the greater volumes would be "heating up" or have the hotter color temperature. If the trading volume was less significant then the color temperature and size of the dots would be smaller in size.

SPY Volume Visualization
